

Devin Castillo - Assignment 2: Process & Design

Part II: Identifying Your Product & Target Audience

A. Define Your Product

Answer the following questions in your document:

1. What problem does your product website solve or address?

My product is solving the problem of new gym goers not knowing what to do in the gym. It also helps experienced lifters improve their current routine and training styles.

2. What is your product idea? How does your website support this idea and help solve the problem?

My product idea is a platform where users can find and connect with personal trainers. There is no one platform where gym goers can find a list of personal trainers to message. This helps the problem because it makes an easy way for both the trainer to find customers and the lifters find a trainer.

3. What type of website are you building? (i.e., e-commerce, brochure, portfolio, media, nonprofit, etc.)

I am building an e-commerce website. The site is selling the platform to two different types of users.

4. What is your mission statement? Summarize what your product does, who it's for, and why it matters.

Find and connect with personal trainers or potential clients. This is the product summarized. We are focused on helping both trainers and gym goers have one place where they can message, meet online, and share meal plans and workouts.

B. Profile Of Target Audience

Answer the following questions in your document:

1. Who is the primary audience that your product is trying to reach? Include the following details about your target audience:

- Demographics

- What is the age range of your target audience?

I would say the age range for my app is pretty big with it being around 17-50.

- What is the gender distribution?

There is no specific gender that I would be highlighting or targeting more.

- Which country do your visitors live in?

I am targeting mostly in the US, but since the site will support online meetings, users are not bound by this.

- Do they live in urban or rural areas?

I believe my target audience might lean more towards urban areas.

- Socioeconomic Details

- What is the average income of visitors?

The average income would likely be around \$50,000 to \$70,000/year, but it would vary depending on the user's age and career.

- What level of education do they have?

Visitors would have a wide range of education levels, from high school graduates to college graduates.

- What is their marital or family status?

Most users would likely be single or have small families, but the site would be open to anyone interested in personal training.

- What is their occupation?

Visitors could have many different occupations, but there would be a lot of college students and people working full-time jobs.

- How many hours do they work per week?

Most working users would work around 30-40 hours/week, while college students would work fewer hours.

- Web Behavior

- How often do they use the web?

Visitors would likely use the web every day for work, school, entertainment, shopping, and fitness.

- What kind of device do they use to access the web?

Most visitors would use a smartphone or laptop. Smartphones would be more common, since not everyone has a laptop or pc.

2. Create a chart with at least three fictional visitors from your target audience. This chart should include at least their name, sex, age, location, occupation, income and web use. You can create this chart manually or with AI tools like [ChatGPT](#).

Name	Sex	Age	Location	Occupation	Income	Web Use
Emily Rodriguez	Female	20	Boston, MA	College Student	\$15,000	Uses her phone and laptop daily for school, social media, and fitness
Marcus Johnson	Male	27	Atlanta, GA	Software Developer	\$85,000	Uses the web daily for work, shopping, entertainment, and fitness
Jordan Lake	Male	32	Houston, TX	Graphic Designer	\$55,000	Uses phone and laptop daily for work, fitness research, and social media

3. Create a list of reasons why people would be coming to your site and assign the list of tasks to the fictional visitors you created. You can complete this step manually or with AI tools like [ChatGPT](#).
 1. Find a personal trainer: Emily wants to find a beginner-friendly trainer who fits her budget.
 2. Compare trainers: Marcus wants to compare trainers based on experience, specialties, and pricing.
 3. Find a trainer for a specific goal: Jordan wants to find a trainer who specializes in his fitness goals.
 4. Read trainer reviews: Emily wants to see reviews from other clients before choosing a trainer.
 5. Book a training session: Marcus wants to schedule an online session with a trainer.
 6. Message a trainer: Jordan wants to communicate with a potential trainer before booking.
 7. Learn about trainers: Emily wants to view trainer profiles, qualifications, and coaching styles.

Part III: Planning & Designing Your Product Website

A. Website Requirements

By addressing the questions below, you'll gain valuable insights into how to design a website that meets your goals and expectations.

1. Purpose & Goals

Answer the following questions in your document:

- What is the primary goal of your website (i.e., promote a service, sell a product, educate users, raise awareness, etc.)?

The primary goal is to connect people with personal trainers who fit their fitness goals, budget, and preferences. The site will make finding a trustworthy trainer easier and less intimidating.

- What is the most important action you want users to take on your site (i.e., sign up, purchase, read articles, submit a form, etc.)?

The most important action is for users to find a trainer and book a training session with them. On the trainer side, they find clients and interact with them.

2. Content & Features

Answer the following questions in your document:

- What content and features are essential to help users achieve their goals? List critical pages and features (i.e., About, Contact Form, Product Gallery, FAQs, Reviews, etc.).

Important pages and features include trainer profiles, a trainer search and matching system, reviews, pricing, messaging, and scheduling.

- What will your homepage highlight? Think about the first impression and what visitors need to see right away.

The homepage will be a quick hub where users can jump to find a personal trainer if they do not have one, or jump to the screen for their current personal trainer.

3. Look & Feel

Answer the following questions in your document:

- Do you have examples of websites that inspire your design? List 1–2 examples and what you like about them (i.e., layout, colors, interactivity, etc.).

I will be taking inspiration from betterhelp and instagram. Better help is what I am remixing from. For colors, I think I will be going for a white and light blue theme. There will also be some animations throughout the site.

- How would you describe the overall style of your site (i.e., modern, bold, minimalist, playful, professional, etc.)?

The website will be a mix of modern and minimalist.

- Do you have preferences for color, fonts, or imagery? If not, what mood or personality do you want the site to convey?

For the mood or personality, I want it to fit that workout/somewhat gritty vibe.

B. Design & Prototyping

1. SDLC Approach & Timeline

- The SDLC model you've chosen (Waterfall, Agile, Scrum, etc.).

I will use the Agile SDLC model because it allows me to build the website in smaller parts, test features as I go, and make changes based on feedback. Agile also works since for this website, user feedback will be very important.

- A clear timeline of phases and milestones.

Week 1, Planning & Requirements: Define the website's goals, target users, main features, and requirements.

Week 2, Design: Create wireframes and design the homepage, trainer profiles, and overall user experience.

Week 3, Development Sprint 1: Build the homepage, trainer profiles, and basic website navigation.

Week 4, Development Sprint 2: Add the trainer search and matching system, reviews, messaging, and scheduling features.

Week 5, Testing & Feedback: Test the website for bugs and usability issues and gather feedback from potential users.

Week 6, Final Improvements & Launch: Make final improvements based on feedback, complete testing, and prepare the website for launch.

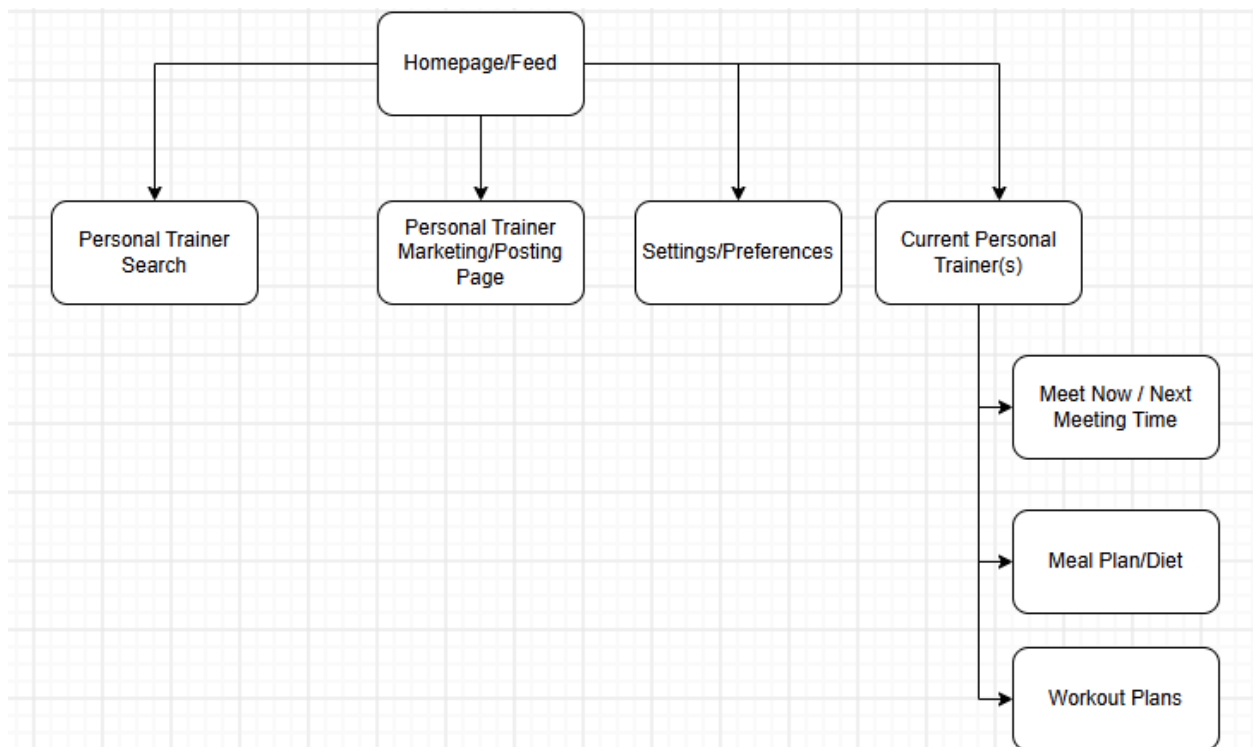

- A visual representation of your timeline (e.g., Gantt chart, flowchart, or detailed bullet list).

Planning -> Design -> Development 1 -> Development 2 -> Testing -> Final Improvements -> Launch

2. Original Logo

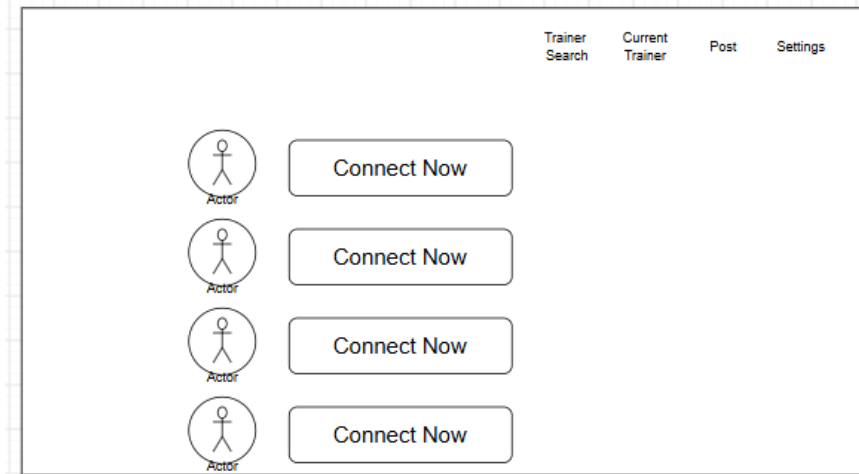

The logo for 'BetterGains' features the word 'Better' in a bold, black, sans-serif font, followed by 'Gains' in a bold, blue, sans-serif font. The 'G' in 'Gains' is stylized with a blue dot above it.

3. Site Map

4. Wireframe

- Homepage:

5. Accessibility

In your answer document, explain how your product website will be made accessible from the start. Your plan should include:

- Specific features you will implement to support users with visual, hearing, motor and cognitive impairments.
- Tools you will use to audit your site for accessibility.

I will make BetterGains accessible from the beginning by using clear headings, readable fonts, strong color contrast, having alt text for images, and keyboard navigation. For users with hearing impairments, videos will include captions, people with motor or cognitive impairments will have simple navigation. To audit the website, I will use tools such as WAVE to identify accessibility issues and make sure the site follows accessibility standards.
